1. Background

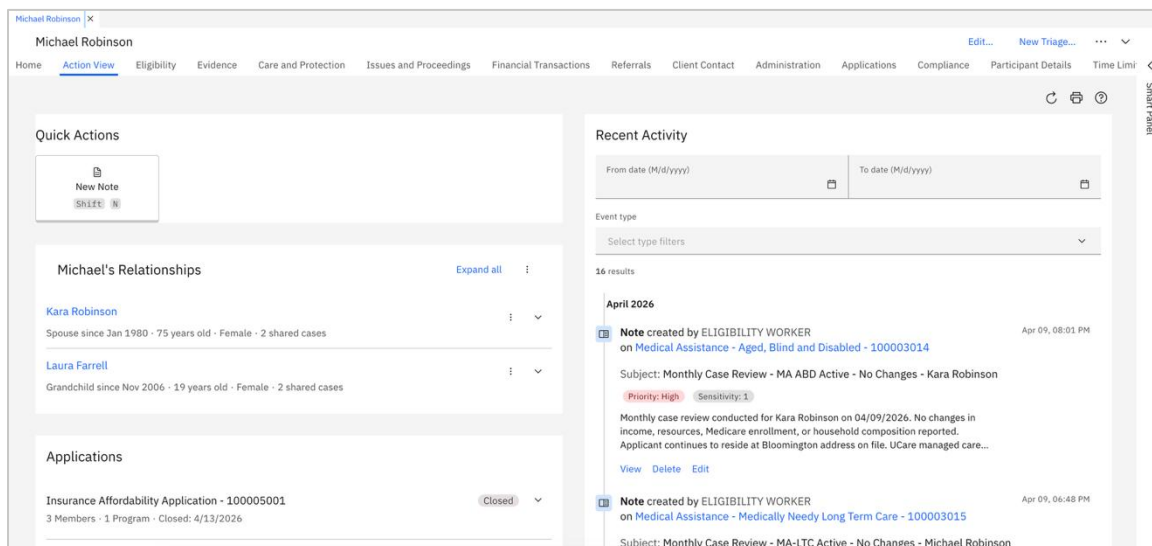

Cúram Action View (known as Action View) is more than a dashboard. It is designed to become the **primary operational interface** for frontline users by combining visibility of core data with quick, in-context actions. This includes access to payment and entitlement details, integrated and product delivery cases, application status, outstanding work items, case and person notes, recent activities, and household relationships. By grouping this information together, Action View reduces the need to move between multiple screens and records, allowing staff to understand a client's current situation and quickly take appropriate action from the single page.

Another important aspect of the solution is its **configurability**. Action View uses a flexible card-based model that allows organizations to tailor the workspace to their own processes and user roles. Out-of-the-box content and behaviour can be modified, custom cards can be introduced, and certain features—such as quick actions—can be enabled or disabled. This means the value of Action View depends not only on the product itself, but also on how well it is configured to reflect operational priorities and service design.

The recommended implementation approach is predominantly **business-led**. Rather than treating Action View as a technical add-on, it is important to start with business objectives and priority user journeys. Once those are established, then aligning cards to core processes such as cases, applications, and relationships. From there, organizations should map data structures to the interface, configure layouts by role, add operationally relevant quick actions, extend with custom cards where required, validate with users, and provide training and enablement. Once business flow and data mapping identified, technical evaluation of that flow to consider performance which is also part of the users experience. This reflects an understanding that adoption and usability are central to realizing benefits.

Overall, Action View is a strategic enhancement to the caseworker experience and service delivery, with the potential to improve efficiency, simplify access to key information, and support more coordinated case management. Its main differentiators are its ability to unify fragmented operational data and its flexibility to be shaped around specific business contexts.

This document describes the scope of the General Availability (GA) Release and provides guidance on implementation activities that will maximise the effectiveness of Cúram Action View.

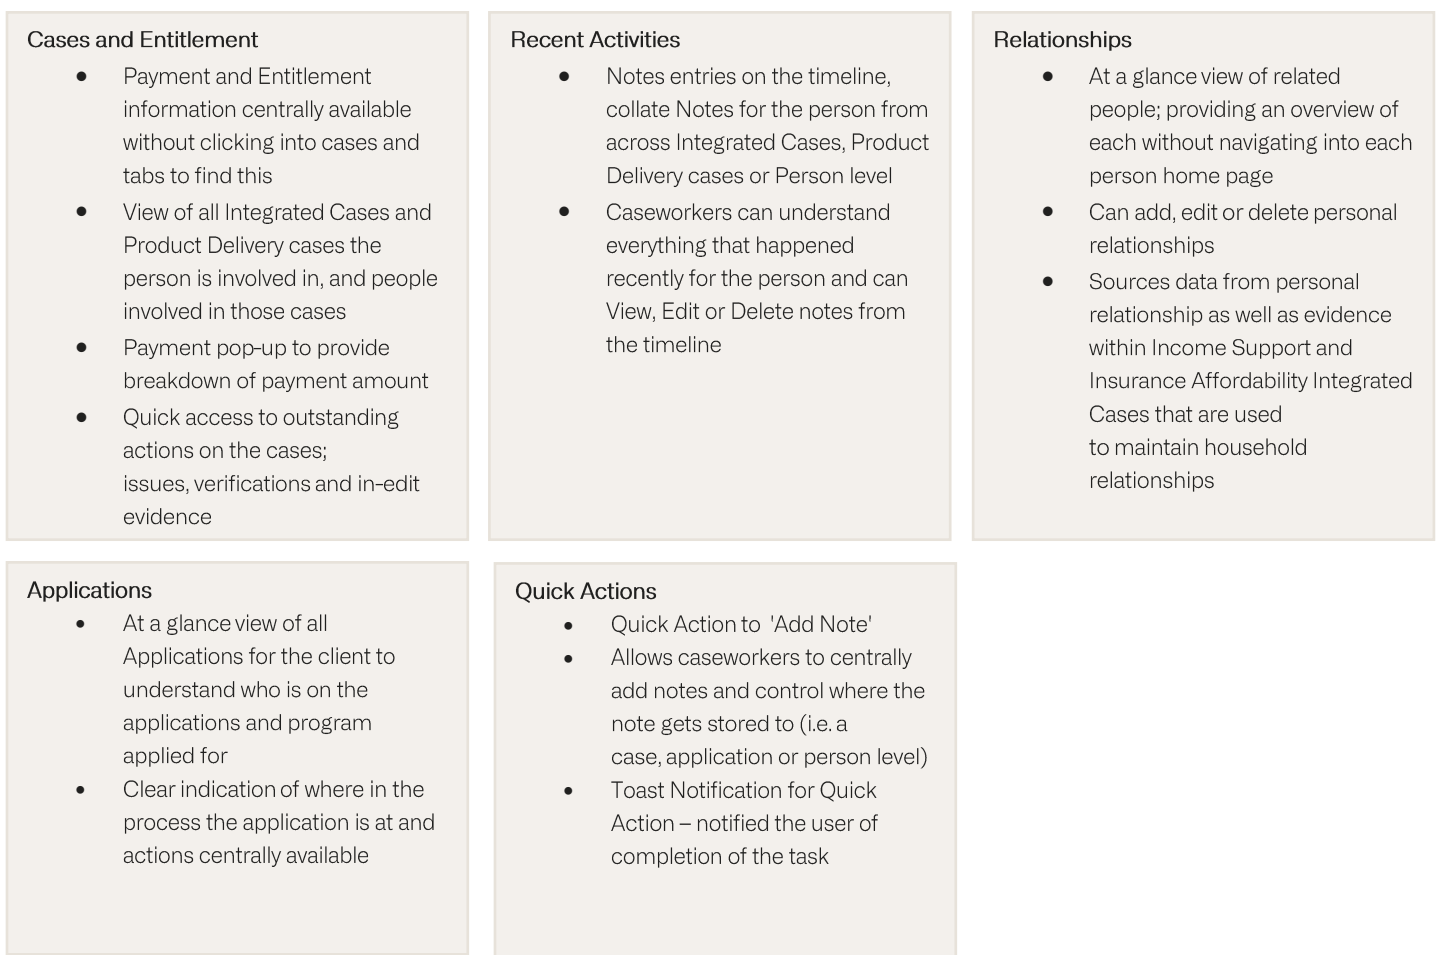

2. General Availability – Release Scope

The GA Release is focused on practical caseworker needs. These include the key capabilities of:

- centralized payment and entitlement visibility
- detailed payment breakdowns
- the ability to view and manage a consolidated view of notes
- visibility of progress in applications
- relationship management

The solution also supports quick actions such as adding notes centrally while controlling whether they are stored against the case, application, or person record. These features are intended to improve day-to-day efficiency and make it easier to act immediately informed by relevant information, avoiding the need to defer action while information is being checked.

The following diagram provides a contextual overview of the scope of the GA Release:

Details regarding the GA Release may be found in Appendix 2

Configuration and Customization Options

A number of configuration and customization options will be available as part of the GA Release:

Configuration & Customization Support

- Choose cards to display
- Choose where cards appear (layout)
- Create new custom cards
- Ability to disable OOTB Quick Actions (Add Note)
- Ability to disable the Show/Hide of SSN (Relationships card)

For guidance on these options see development guidelines located at: [Technical Documentation](#).

Release Strategy

The GA Release of Action View is scheduled for 25th June 2026. Following this, new features will be incrementally released, on a monthly release cycle. Cúram Action View installs on top of the existing release, so there is no requirement to uninstall the existing version before installing the new version. The Cúram Action View guide contains technical information including upgrades.

3. Implementation Approach

When implementing Action View, it's important to maintain the focus on identifying and improving key user journeys that will bring value to customer operations through improved productivity or workflow consistency. Keep in mind that Action View is a new tab – all other capabilities remain the same, providing an opportunity to gradually adopt new workflows and minimize disruptions.

To start, deploy the latest version of Cúram Action View in local environment and provide the relevant users with access for education and familiarization.

The steps below outline our suggested implementation approach, offering insights and guidance on various activities and considerations for a smooth implementation that delivers value to the business.

1. Start with clearly defined business outcomes and priority user journeys

Define measurable operational outcomes (e.g. reduced navigation, faster decision-making, improved caseworker productivity) and anchor the implementation around high-value frontline journeys such as case management, applications, and relationship handling.

- Start with clear business objectives

Implementation should begin with a clear understanding of **what operational outcomes the organization wants to improve**, for example, reducing navigation, improving caseworker productivity, or surfacing payment, application, and relationship information more effectively. Without this, configuration risks becoming feature led rather than outcome led.

- Prioritize user journeys, not just features

A critical success factor is defining the **priority user journeys** upfront. Cúram Action View should support the most important frontline workflows, particularly around **cases, applications, entitlements, relationships, and outstanding actions**. This ensures the interface reflects how users actually work.

2. Undertake structured process discovery and prioritized use case selection

Analyze current workflows at team level to identify high-frequency, high-effort, and high-friction activities, then prioritize a small number of high-impact use cases to maximize early value and adoption. See Appendix 1 for further guidance.

3. Align Action View cards to core business processes and operational context

Define the To Be workflows for the prioritized journeys. Don't forget to consider how the caseworker will get to Action View, for example:

- Opening Action View from the Person Search page
- Opening Action View from the Smart Nav or the links shown with Tasks
- Making Action View the default page when navigating to the Person profile (at present this would likely be the home page)

Configure cards to reflect real caseworker tasks, ensuring that cases, applications, relationships, evidence, and activities are surfaced in a single, contextually relevant view to support informed, in-the-moment actions.

Because the solution is **card-based**, its effectiveness depends on how well those cards map to key business processes. Successful implementations will ensure that the most relevant cards are organized around **real case management tasks**, rather than simply mirroring the underlying system structure.

4. Perform rigorous fit–gap analysis to define the delivery approach

Assess use case requirements against Action View capabilities to determine whether they are best met through out-of-the-box functionality, configuration, extension of existing cards, or development of new custom cards, ensuring traceability to business needs.

As with other implementations of Cúram, expert users must perform a fit gap of what the customer requires for Cúram Action View, and what is currently provided OOTB. This will result in four possible outcomes:

1. Can be met OOTB
2. Can be met with configuration
3. Can be met by altering card content
4. Can be met by introducing new cards

Map **existing evidence and data structures to UI components**. This is a major success factor because Cúram Action View's usefulness depends on whether the right information appears in the right place, with the right context. Poor alignment here would undermine trust and usability.

5. Configure by role and optimize for usability while minimizing customization

Tailor layouts, data visibility, and quick actions to distinct user roles (e.g. caseworkers, supervisors), prioritizing configuration over bespoke development to maintain upgradeability, reduce technical debt, and support scalability.

6. Validate iteratively with users and embed structured change management

Engage real users early to test layouts, information hierarchy, and quick actions within Action View, refining iteratively to ensure the solution reflects actual working practices, while reinforcing adoption through targeted change and training updates.

User validation is explicitly included in the implementation approach and is one of the most important success factors. Since Cúram Action View is intended to improve day-to-day caseworker experience, feedback from real users is essential to confirm that the layout, information hierarchy, and actions support actual work patterns.

7. Deliver focused initial release with embedded training and low-risk adoption

Implementation is not complete without **training and enablement**. Even a well-designed workspace will not deliver full value unless users understand how to navigate it, use quick actions effectively, and incorporate it into their daily case management routines. For roles and processes that are changing it will be necessary to identify training materials that support existing processes and update them to reflect the use of Action View to achieve the same objective.

Remember that Action View is not replacing existing Cúram functionality; it is providing a new and improved way to do things, but the old way of doing things is still supported by the Cúram system. This makes implementation of new

process very low risk and simple. As soon as users are trained, they can simply begin to take advantage of the new technology, confident that the old capability remains available if needed.

Deploy Action View for selected use cases in a controlled release, provide role-based enablement, and support parallel use with existing functionality to enable immediate productivity gains with minimal operational disruption.

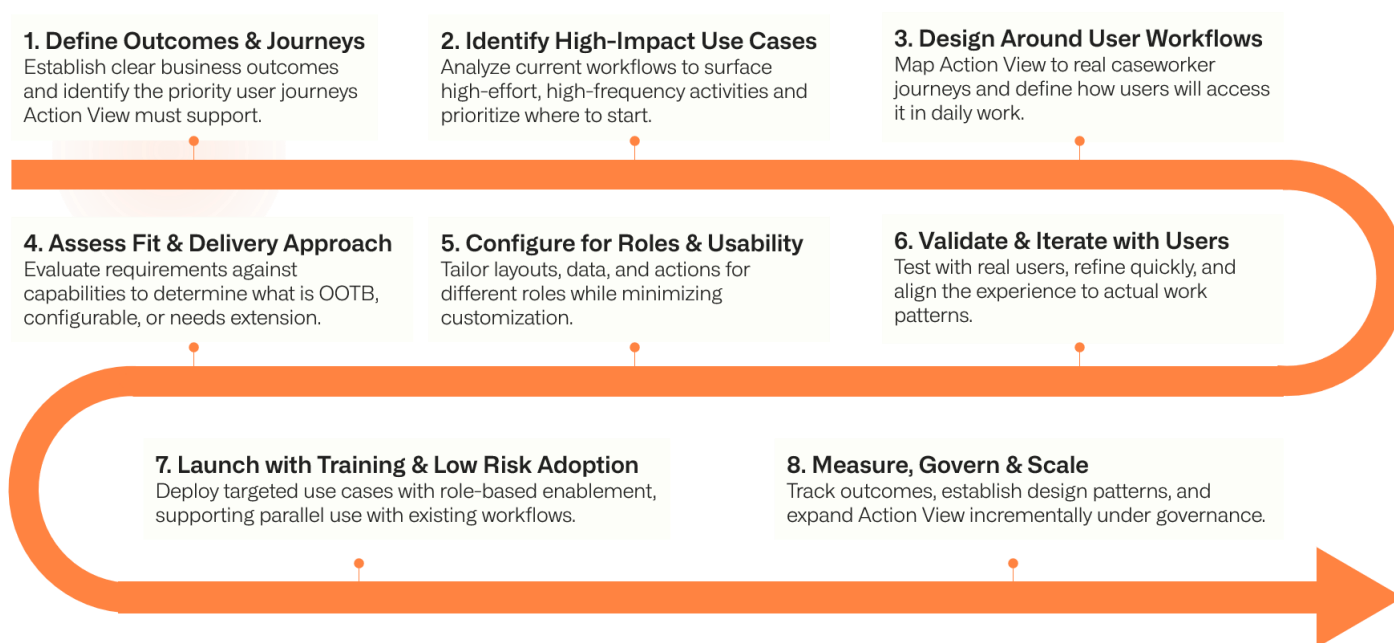

8. Measure outcomes and scale incrementally under governance control

Track tangible improvements (e.g. reduced clicks, processing time, error rates), establish reusable design patterns, and expand Action View adoption across additional processes through a governed, iterative rollout aligned to business priorities.

Customers might wish to benchmark their existing processes to give them a comparison with the new processes that are implemented based on Action View. Some customers have noted large percentage improvements (50% to 80%) in processing effort/time and evidence of improvement could be helpful in justifying investment in implementing future releases of Action View.

8 Steps to Successful Action View Implementation

A continuous journey for aligning business processes with card-based UI frameworks

The above implementation approach for the GA Release can be repeated for all future iterations of Cúram Action View. Essentially, the Services Team or engaged SI can work closely with business SMEs to identify which critical business processes can be supported by Cúram Action View, and how best to implement the Action View capability to enhance those business processes.

4. Useful Support

Documentation

The following topics will be covered within the Cúram Action View guide:

- Business
 - Describing how Action View functions
- Technical
 - Developing in the new UI Dev Env – information/guidance to developers
 - Customisation / Configuration support and guidance
 - Upgrade information

Appendix 1 – Approach to selecting high impact Use Cases for Action View Consideration

The steps below outline an approach to identifying use cases for Action View enhancement. This approach is intended to focus effort on delivering maximum business value in the fastest time. These steps are iterative in nature and the business should consider all its use cases and teams for Action View enhancement.

Step	Activity	Notes/Tasks
1	Identify the teams that use the system	• How many different teams do you have using the system?
2	Document each team's responsibilities	• What are the responsibilities performed by each team?
3	For each team, evaluate candidate Action View use cases	• From the list of responsibilities, create a list of use cases describing the work done by that team. • Identify the high-frequency use cases – the most common enquiries and actions. Remember that some activities within larger workflows may be considered use cases, when they are common to many process workflows, for example context gathering to determine the latest position on cases, might be the first part of many workflows. • Identify high effort use cases. Consider factors such as: • number of keystrokes/clicks, • decision points, • exceptions, • roles involved, • most frustrating for users, • highest time pressure for users. • Repeat this evaluation as required for each team.
4	Select the priority use cases for initial Action View adoption	• Choose 3 use cases from the use case list: 2 high effort use cases and 1 most frequently occurring use case.

Appendix 2 – General Availability – Scope Details

General Availability – Scope Details

The sections below describe the different sections of the Action View screen (known as cards) and the capabilities offered within them.

Cases and Entitlement

Cases and Entitlement

Open integrated casesClosed integrated cases

Income Support - 56745
5 cases · 5 household members · Start date: 7/18/2025

Members (5)
Sarah Johnson (*Primary*), age 37, David Johnson, age 41, Ethan Johnson, age 13, Lily Johnson, age 13, Linda Johnson, age 2

[Items to verify \(1\)](#) [Evidence in edit \(1\)](#) [Issues \(0\)](#)

Cash Assistance - 263 Case status Active Start date 7/18/2025	Sarah Johnson (<i>Primary</i>), age 37 David Johnson, age 41 Ethan Johnson, age 13 Lily Johnson, age 13 Linda Johnson, age 2	Expected next payment \$616.00 (due 5/1/2026) Previous payment \$628.00 (due 4/1/2026)
Details Entitlement \$632.00 (8/1/2025 - 6/30/2026) Nominees Sarah Johnson, Benefit Amount Case Owner SUPER USER View payments → View determination history →		

The Cases and Entitlement card will provide a central view of Payment and Entitlement information without the user needing to click into cases and tabs. It includes the following key features:

- View of all Integrated Cases and Product Delivery cases the client is involved in, and the other people involved in those cases
- Payment pop-up to provide breakdown of payment amount
- Quick access to outstanding actions on the cases; issues, verifications and in-edit evidence

Note created by ELIGIBILITY WORKER on [Income Support - 261](#)

Jun 17, 03:05 PM

Subject: Case Review - No Changes - Kara Robinson

Reviewed the citizen's application in advance of the scheduled interview to compile a checklist of the items necessary to advance her benefit application. She has previously been advised of the required information and documentation.

[View](#) [Delete](#) [Edit](#) ELIGIBILITY WORKER is editing the note. You can append to it from Jun 20 at 03:05 PM

July 2025

Note created by SUPER USER on [Income Support Application - 34567](#)

Jul 19, 01:00 PM

Subject: Interview scheduled – documents requested and additional contact provided

I called Maria again as agreed, and this time she was available to speak. An in-person interview was scheduled for July 21st. I informed her of the documents she should bring - Proof of citizenship for all household members applying for benefits ,...

[View](#) [Delete](#) [Edit](#)

The Recent Activity card provides the following information:

- Notes entries which have been created in Cúram at the levels of Integrated Case, Product Delivery case or Person
- Provides Notes consolidation so caseworkers can understand everything that happened recently for the person
- Caseworkers can View, Edit or Delete notes from the timeline
- It will also provide details of the Person Registration for the Client

In Edit

The Relationships card provides at a glance view of related people, including the following:

- An overview of each Client relationship without navigating into each person home page
- Can add, edit or remove relationships
- Displays any Special Cautions for the Client and related Participants
- Can be configured to display only a reference number on selection of an 'eye' icon
- Uses personal relationship data but solutions cases customers such as DC, SC, MN etc can configure it to use the Household Member evidence instead

The Applications card is an overview of all Applications, showing who is the subject of all in progress applications. This includes the following features:

- Any outstanding Verifications and Evidence Issues
- Any Evidences that are still in edit
- The associated Household Members
- Clear indication of the status of the application process
- Take actions directly from the card with no need to navigate to other pages
