Scenario - Application submitted by a client through the portal	14

1. Background

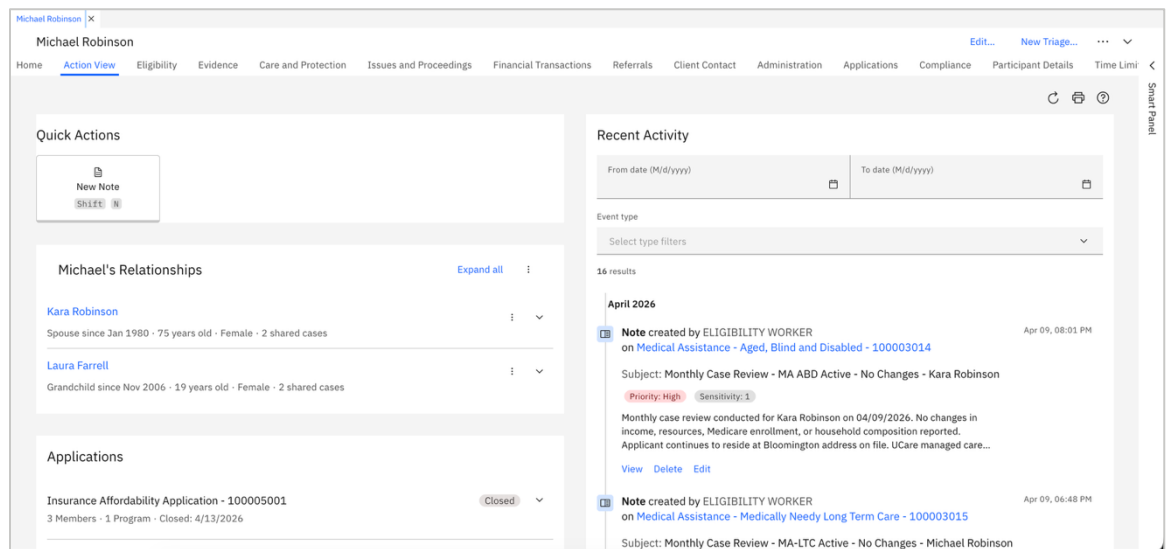

Cúram Action View (known as Action View) is more than a dashboard. It is designed to become the **primary operational interface** for frontline users by combining visibility of core data with quick, in-context actions. This includes access to payment and entitlement details, integrated and product delivery cases, application status, outstanding work items, case and person notes, recent activities, and household relationships. By grouping this information together, Action View reduces the need to move between multiple screens and records, allowing staff to understand a client's current situation and quickly take appropriate action from the single page.

Another important aspect of the solution is its **configurability**. Action View uses a flexible card-based model that allows organizations to tailor the workspace to their own processes and user roles. Out-of-the-box content and behaviour can be modified, custom cards can be introduced, and certain features—such as quick actions—can be enabled or disabled. This means the value of Action View depends not only on the product itself, but also on how well it is configured to reflect operational priorities and service design.

The recommended implementation approach is predominantly **business-led**. Rather than treating Action View as a technical add-on, it is important to start with business objectives and priority user journeys. Once those are established, then aligning cards to core processes such as cases, applications, and relationships. From there, organizations should map data structures to the interface, configure layouts by role, add operationally relevant quick actions, extend with custom cards where required, validate with users, and provide training and enablement. Once business flow and data mapping identified, technical evaluation of that flow to consider performance which is also part of the users experience. This reflects an understanding that adoption and usability are central to realizing benefits.

Overall, Action View is a strategic enhancement to the caseworker experience and service delivery, with the potential to improve efficiency, simplify access to key information, and support more coordinated case management. Its main differentiators are its ability to unify fragmented operational data and its flexibility to be shaped around specific business contexts.

This document describes the scope of the General Availability (GA) Release and provides guidance on implementation activities that will maximise the effectiveness of Cúram Action View.

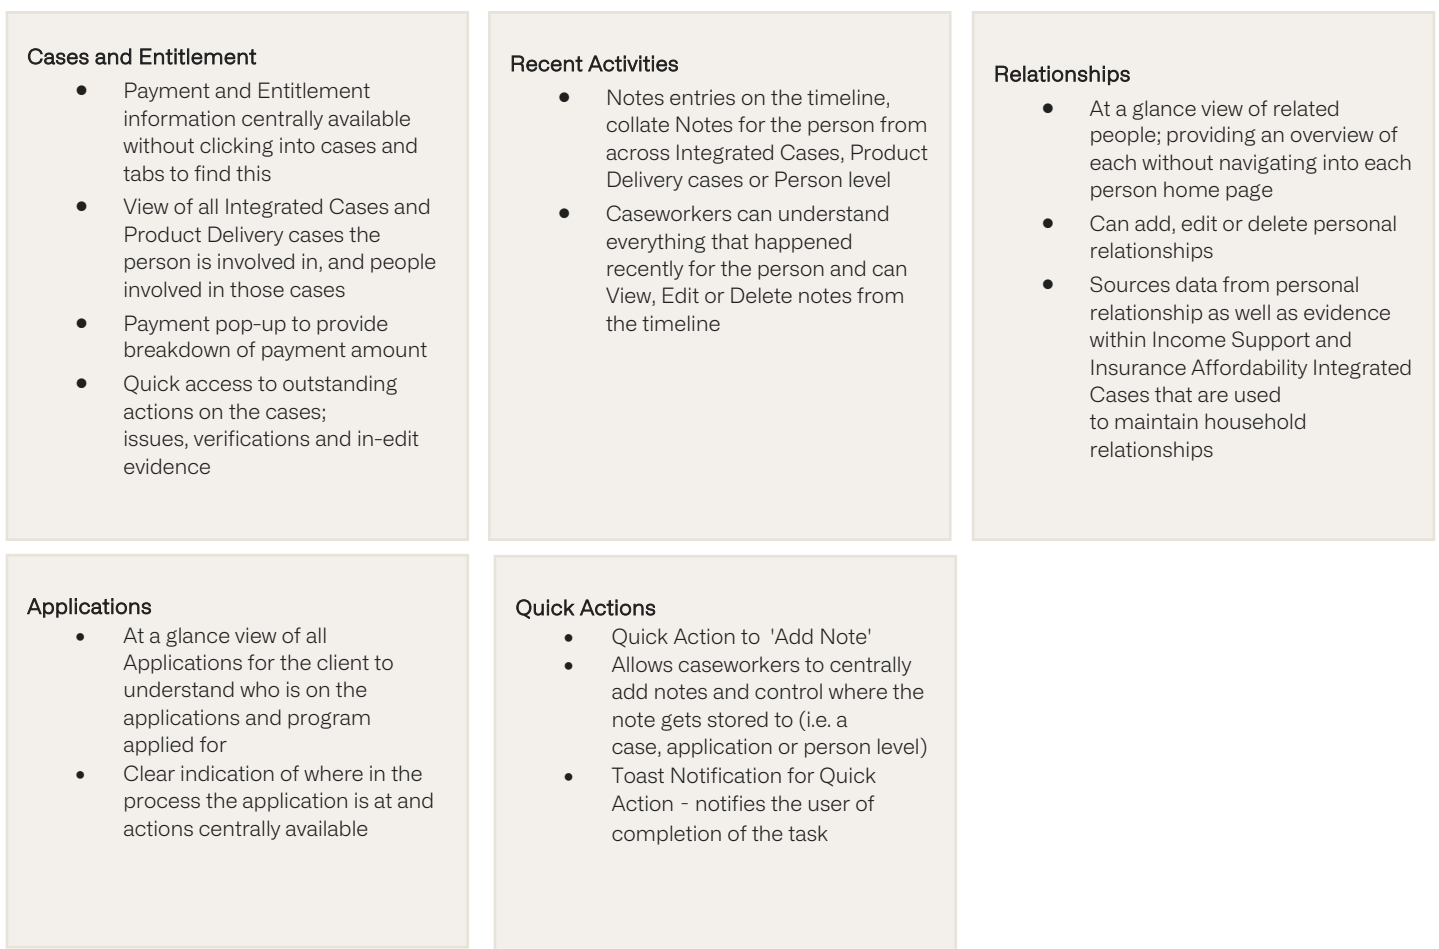

2. General Availability – Release Scope

The GA Release is focused on practical caseworker needs. These include the key capabilities of:

- centralized payment and entitlement visibility
- detailed payment breakdowns
- the ability to view and manage a consolidated view of notes
- visibility of progress in applications
- relationship management

The solution also supports quick actions such as adding notes centrally while controlling whether they are stored against the case, application, or person record. These features are intended to improve day-to-day efficiency and make it easier to act immediately informed by relevant information, avoiding the need to defer action while information is being checked.

The following diagram provides a contextual overview of the scope of the GA Release:

Details regarding the GA Release may be found in Appendix 2

Configuration and Customization Options

A number of configuration and customization options will be available as part of the GA Release:

Configuration & Customization Support

- Choose cards to display
- Choose where cards appear (layout)
- Create new custom cards
- Ability to disable OOTB Quick Actions (Add Note)
- Ability to disable the Show/Hide of SSN (Relationships card)

For guidance on these options see development guidelines located at: [Technical Documentation](#).

Performance Guidance for Implementation Teams

Action View should be treated as a **specialized workload**, not simply another application page. Because it aggregates data from across the system into a single view, its performance is driven by the combined cost of all contributing data sources and the volume of information associated with a person or case. Records with extensive histories (cases, payments, evidence, interactions, etc.) can create significantly higher load than average records. Additionally, Action View involves multiple REST API calls, making the performance and sizing of the REST application important for acceptable response times.

Key implementation considerations:

- **Test Action View independently** using production-representative data, including the largest and most complex cases, and at realistic concurrency levels. Average-sized test data will understate performance risks.
- **Monitor 95th and 99th percentile response times**, not just averages. The worst-performing records drive user experience and capacity requirements.
- **Control page content carefully**. Each additional card, section, or panel increases render cost. Treat new content as consuming a finite performance budget.
- **Limit data retrieval wherever possible**. Configure cards (such as timelines) with narrow default filters and retrieve only the data needed for the primary workflow.
- **Size and tune the REST EAR appropriately**. JVM resources, thread pools, and connection pools should be designed for peak Action View usage rather than average system activity.
- **Maintain database health rigorously**. Indexing, statistics maintenance, and query tuning have an outsized impact because Action View amplifies underlying data-layer inefficiencies.
- **Consider lazy loading for expensive content**. Deferring heavy sections until requested can significantly improve initial page responsiveness.

Bottom line: Design, test, and capacity-plan for the largest records and peak concurrency—not the average case. Action View is often the first area to expose database, query, or REST-tier bottlenecks, making it both a performance risk and an early indicator of overall system health.

Release Strategy

Following initial release on 25th June 2026, new features will be incrementally released, on a monthly release cycle. Cúram Action View installs on top of the existing release, so there is no requirement to uninstall the existing version before installing the new version. The Cúram Action View guide contains technical information including upgrades.

3. Implementation Approach

When implementing Action View, it's important to maintain the focus on identifying and improving key user journeys that will bring value to customer operations through improved productivity or workflow consistency. Keep in mind that Action View is a new tab – all other capabilities remain the same, providing an opportunity to gradually adopt new workflows and minimize disruptions.

To start, deploy the latest version of Cúram Action View in local environment and provide the relevant users with access for education and familiarization.

The steps below outline our suggested implementation approach, offering insights and guidance on various activities and considerations for a smooth implementation that delivers value to the business.

1. Start with clearly defined business outcomes and priority user journeys

Define measurable operational outcomes (e.g. reduced navigation, faster decision-making, improved caseworker productivity) and anchor the implementation around high-value frontline journeys such as case management, applications, and relationship handling.

- Start with clear business objectives

Implementation should begin with a clear understanding of **what operational outcomes the organization wants to improve**, for example, reducing navigation, improving caseworker productivity, or surfacing payment, application, and relationship information more effectively. Without this, configuration risks becoming feature led rather than outcome led.

- Prioritize user journeys, not just features

A critical success factor is defining the **priority user journeys** upfront. Cúram Action View should support the most important frontline workflows, particularly around **cases, applications, entitlements, relationships, and outstanding actions**. This ensures the interface reflects how users work.

2. Undertake structured process discovery and prioritized use case selection

Analyze current workflows at team level to identify high-frequency, high-effort, and high-friction activities, then prioritize a small number of high-impact use cases to maximize early value and adoption. See Appendix 1 for further guidance.

3. Align Action View cards to core business processes and operational context

Define the To Be workflows for the prioritized journeys. Don't forget to consider how the caseworker will get to Action View, for example:

- Opening Action View from the Person Search page
- Opening Action View from the Smart Nav or the links shown with Tasks
- Making Action View the default page when navigating to the Person profile (at present this would likely be the home page)

Configure cards to reflect real caseworker tasks, ensuring that cases, applications, relationships, evidence, and activities are surfaced in a single, contextually relevant view to support informed, in-the-moment actions.

Because the solution is **card-based**, its effectiveness depends on how well those cards map to key business processes. Successful implementations will ensure that the most relevant cards are organized around **real case management tasks**, rather than simply mirroring the underlying system structure.

4. Perform rigorous fit-gap analysis to define the delivery approach

Assess use case requirements against Action View capabilities to determine whether they are best met through out-of-the-box functionality, configuration, extension of existing cards, or development of new custom cards, ensuring traceability to business needs.

As with other implementations of Cúram, expert users must perform a fit gap of what the customer requires for Cúram Action View, and what is currently provided OOTB. This will result in four possible outcomes:

1. Can be met OOTB
2. Can be met with configuration
3. Can be met by altering card content
4. Can be met by introducing new cards

Map existing data structures to UI components. This is a major success factor because Cúram Action View's usefulness depends on whether the right information appears in the right place, with the right context. Poor alignment here would undermine trust and usability.

5. Configure by role and optimize for usability while minimizing customization

Tailor layouts, data visibility, and quick actions to distinct user roles (e.g. caseworkers, supervisors), prioritizing configuration over bespoke development to maintain upgradeability, reduce technical debt, and support scalability.

6. Validate iteratively with users and embed structured change management

Engage real users early to test layouts, information hierarchy, and quick actions within Action View, refining iteratively to ensure the solution reflects actual working practices, while reinforcing adoption through targeted change and training updates.

User validation is explicitly included in the implementation approach and is one of the most important success factors. Since Cúram Action View is intended to improve day-to-day caseworker experience, feedback from real users is essential to confirm that the layout, information hierarchy, and actions support actual work patterns.

7. Deliver focused initial release with embedded training and low-risk adoption

Implementation is not complete without **training and enablement**. Even a well-designed workspace will not deliver full value unless users understand how to navigate it, use quick actions effectively, and incorporate it into their daily case management routines. For roles and processes that are changing it will be necessary to identify training materials that support existing processes and update them to reflect the use of Action View to achieve the same objective.

Remember that Action View is not replacing existing Cúram functionality; it is providing a new and improved way to do things, but the old way of doing things is still supported by the Cúram system. This makes implementation of new process very low risk and simple. As soon as users are trained, they can simply begin to take advantage of the new technology, confident that the old capability remains available if needed.

Deploy Action View for selected use cases in a controlled release, provide role-based enablement, and support parallel use with existing functionality to enable immediate productivity gains with minimal operational disruption.

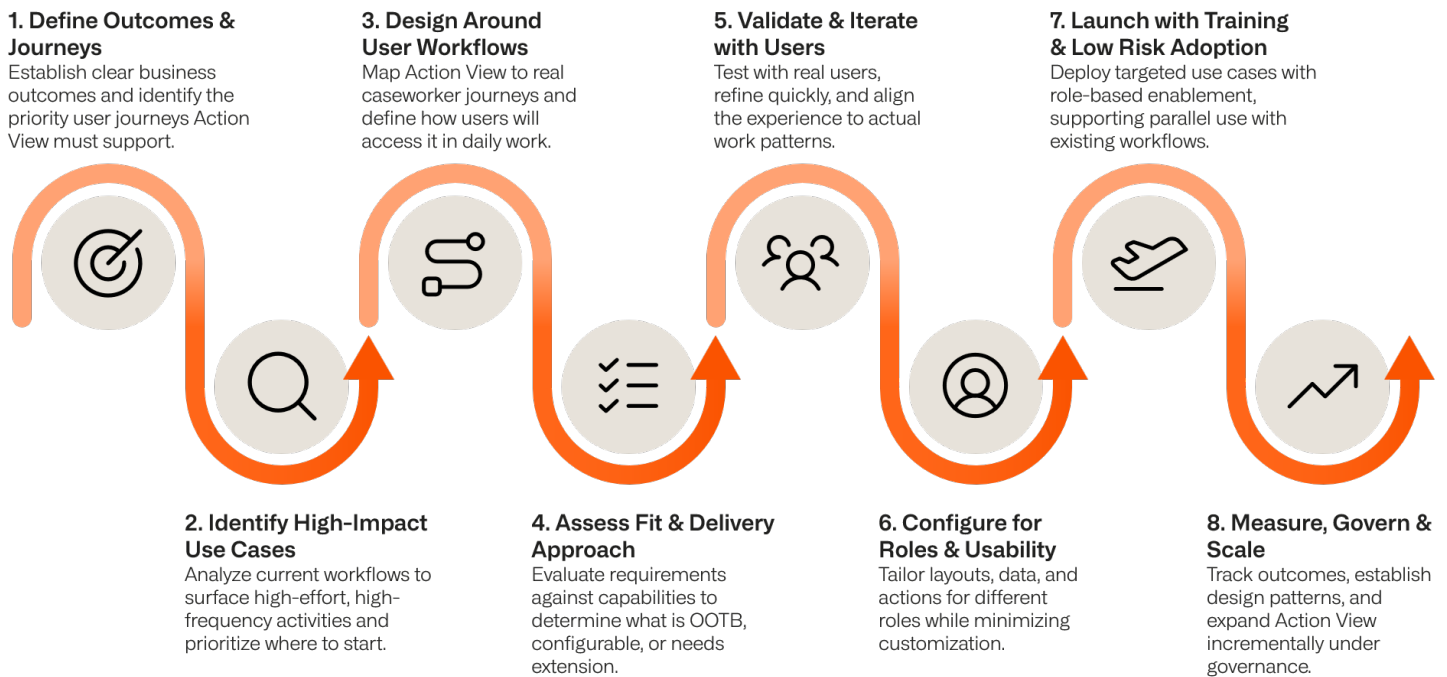

8. Measure outcomes and scale incrementally under governance control

Track tangible improvements (e.g. reduced clicks, processing time, error rates), establish reusable design patterns, and expand Action View adoption across additional processes through a governed, iterative rollout aligned to business priorities.

Customers might wish to benchmark their existing processes to give them a comparison with the new processes that are implemented based on Action View. Some customers have noted large percentage improvements (50% to 80%) in processing effort/time and evidence of improvement could be helpful in justifying investment in implementing future releases of Action View.

8 Steps to Successful Action View Implementation

A continuous journey for aligning business processes with card-based UI frameworks

The above implementation approach for the GA Release can be repeated for all future iterations of Cúram Action View. Essentially, the Services Team or engaged SI can work closely with business SMEs to identify which critical business processes can be supported by Cúram Action View, and how best to implement the Action View capability to enhance those business processes.

4. Useful Support

Documentation

The following topics will be covered within the Cúram Action View guide:

- Business
 - Describing how Action View functions
- Technical
 - Developing in the new UI Dev Env – information/guidance to developers
 - Customisation / Configuration support and guidance
 - Upgrade information

Appendix 1 – Approach to selecting high impact Use Cases for Action View Consideration

The steps below outline an approach to identifying use cases for Action View enhancement. This approach is intended to focus effort on delivering maximum business value in the fastest time. These steps are iterative in nature and the business should consider all its use cases and teams for Action View enhancement.

Step	Activity	Notes/Tasks
1	Identify the teams that use the system	• How many different teams do you have using the system?
2	Document each team's responsibilities	• What are the responsibilities performed by each team?
3	For each team, evaluate candidate Action View use cases	• From the list of responsibilities, create a list of use cases describing the work done by that team. • Identify the high-frequency use cases – the most common enquiries and actions. Remember that some activities within larger workflows may be considered use cases, when they are common to many process workflows, for example context gathering to determine the latest position on cases, might be the first part of many workflows. • Identify high effort use cases. Consider factors such as: • number of keystrokes/clicks, • decision points, • exceptions, • roles involved, • most frustrating for users, • highest time pressure for users. • Repeat this evaluation as required for each team.
4	Select the priority use cases for initial Action View adoption	• Choose 3 use cases from the use case list: 2 high effort use cases and 1 most frequently occurring use case.

Appendix 2 – General Availability – Scope Details

General Availability – Scope Details

The sections below describe the different sections of the Action View screen (known as cards) and the capabilities offered within them.

Cases and Entitlement

Cases and Entitlement

Open integrated casesClosed integrated cases

Income Support - 56745Members (5)
5 cases · 5 household members · Start date: 7/18/2025Sarah Johnson (Primary), age 37, David Johnson, age 41, Ethan Johnson, age 13, Lily Johnson, age 13, Linda Johnson, age 2

Items to verify (1) Evidence in edit (1) Issues (0)

Programs	Members	Payments
Cash Assistance - 263 Case status: ActiveStart date: 7/18/2025	Sarah Johnson (Primary), age 37 David Johnson, age 41 Ethan Johnson, age 13 Lily Johnson, age 13 Linda Johnson, age 2	Expected next payment \$616.00 (due 5/1/2026) Previous payment \$628.00 (due 4/1/2026)
Details Entitlement: \$632.00 (8/1/2025 - 6/30/2026)Case Owner: SUPER USER Nominees: Sarah Johnson, Benefit Amount View payments → View determination history →		

The Cases and Entitlement card will provide a central view of Payment and Entitlement information without the user needing to click into cases and tabs. It includes the following key features:

- View of all Integrated Cases and Product Delivery cases the client is involved in, and the other people involved in those cases
- Payment pop-up to provide breakdown of payment amount
- Quick access to outstanding actions on the cases; issues, verifications and in-edit evidence

Note created by ELIGIBILITY WORKER on [Income Support - 261](#)

Jun 17, 03:05 PM

Subject: Case Review - No Changes - Kara Robinson

Reviewed the citizen's application in advance of the scheduled interview to compile a checklist of the items necessary to advance her benefit application. She has previously been advised of the required information and documentation.

[View](#) [Delete](#) [Edit](#) ELIGIBILITY WORKER is editing the note. You can append to it from Jun 20 at 03:05 PM

July 2025

Note created by SUPER USER on [Income Support Application - 34567](#)

Jul 19, 01:00 PM

Subject: Interview scheduled – documents requested and additional contact provided

I called Maria again as agreed, and this time she was available to speak. An in-person interview was scheduled for July 21st. I informed her of the documents she should bring - Proof of citizenship for all household members applying for benefits ,...

[View](#) [Delete](#) [Edit](#)

The Recent Activity card provides the following information:

- Notes entries which have been created in Cúram at the levels of Integrated Case, Product Delivery case or Person
- Provides Notes consolidation so caseworkers can understand everything that happened recently for the person
- Caseworkers can View, Edit or Delete notes from the timeline
- It will also provide details of the Person Registration for the Client

Relationships

1048 Shinn Avenue Pittsburgh, PA, 15212	In Edit

The Relationships card provides at a glance view of related people, including the following:

- An overview of each Client relationship without navigating into each person home page
- Can add, edit or remove relationships
- Displays any Special Cautions for the Client and related Participants
- Can be configured to display only a reference number on selection of an 'eye' icon
- Data for relationships card is taken from personal relationships plus for solution customers, Income Support and Insurance Affordability, data can also be sourced from Household Member evidences at Integrated Case level.

The Applications card is an overview of all Applications, showing who is involved in the in-progress applications. The applications card includes the following features:

- Quick links to any outstanding verifications, evidence issues and in-edit evidence for the application
- Indication of everyone on the application as well as the programs being applied for
- Clear view of the status and progress of the application process
- Actions updated dynamically to guide users and support action directly from the card with no need to navigate to other pages

A new Quick Action “Add Note” will provide the following features:

- Allow a caseworker to add notes centrally as well as control where the note gets stored (against a specific case/application etc.)
- If the Cúram 8.0.3 feature to edit notes is enabled, notes added through Action View “Add Note” will also be editable for the configured timeframe

Appendix 3 – Example Fit Gap

Below is an example fit gap, providing a real world example of the steps to complete when determining how Action View can be utilized to streamline key workflows. Please note, this is not exhaustive and is meant as a guide only. Each customer will have their own workflows which must be considered. Customers will also have different ways to navigate to applications e.g. Application Cases

Scenario - Application submitted by a client through the portal

A caseworker is assigned the task of reviewing and progressing the application

- In this scenario, “Maria Hernandez” is the client submitting the application for benefit.
- We are receiving the application via an online portal and a task is created for a relevant user to manage the initial eligibility and entitlement workflow
- We pick up the workflow where the caseworker has logged onto the application and accepted the task from the work queue

Workflow Steps	Steps in Cúram without Action View	Steps in Cúram with Action View	Value
Start task	• Select the action to review the Application Case • Open the Application Case home page	No change <i>for now</i> • Select the Application Case link from the task • Navigate to the Person profile to open Curam Action View NB Best practice would be to do an assessment of tasks to determine which ones are suitable for rerouting to Curam Action View so caseworkers do not need to navigate to Curam Action View themselves	
Caseworker must understand the application, what's being applied for and what has been provided	• On the application home page, review the case members, the programs	From Curam Action View, go to the Application card • Review the programs applied for and members • Use the action on the card to open pdf document	At-a-glance understanding of an Application • Central access to all applications (open and closed) ○ Understand who is on the applications and programs applied for ○ Clear indication of the stages involved ○ Caseworkers know where they are in the application process

			○ Ease of access to application actions
Caseworker must research existing Benefits and Entitlement – what the client has applied for compared to what is known about them already on the system	• Navigate to the Person home page • Look at their list of Cases • Click into each Integrated Case and from there click into each program and determination tab • Check if eligible, the cover period and what they are eligible for. • Click into financials to see what has been paid	Go to the Cases and Entitlement card • Expand each Integrated Case and program • Look at the entitlement, components and payments (paid and/or due) • If necessary, check in the 'Closed' list for recently closed out benefits	• Consolidated Case, Payment & Entitlement Insight ○ Central access to all Integrated Cases (open and closed) and Product Delivery cases ○ Get broader context of all cases the person is <u>involved in</u> ○ Understand who is on which cases together ○ Payment and Entitlement information centrally available without clicking into cases and tabs to find this

Caseworker must understand the broader context for the person; who they are related to and if those family members are receiving benefits on behalf of the family	• Navigate to the Person home page • Go to the Evidence tab, filter by type and look for Relationships • Understand who the person is related to • Navigate into the person profile for these people and find relevant information – names, age, address, relationship to the person and what cases they have open	Go to the Relationships card • Select “Expand All” • Read relevant information – names, age, address, relationship to the person and the cases they are on together • Can double-check the Cases and Entitlement card, the ICs/Programs and which of these other family members are receiving the entitlement.	• At-a-glance Related Persons overview Provides a clear understanding of current relationships for a person ○ Provides high level information on each related person; age, SSN, address, relationship to the person, shared cases ○ Navigation into each related person’s profile page no longer required to find this information ○ Clearly shows which individuals live at the same address, with the ability to flag potential address inaccuracies
Caseworker must research recent interactions with the client – any calls/meetings/notice s that may provide insights to the client’s circumstance or what they’ve discussed with the agency already	(The caseworker may do this step alongside the previous one when looking at existing benefits and entitlements, so they are not going into the same ICs multiple times) • Navigate to the Person home page • Look at their list of Cases • Click into each Integrated Case and from there go to the Notes tab • See how recent the notes are – read notes from the last 3-6 months to see if there are any interactions of importance. • Go to the Notes at the Person level also – see how recent the notes are and read notes from the last 3-6 months to see if	Go to the Recent Activity card Using the filter on the timeline, select ‘Notes’ event and filter to the last 30-60 days • All Notes listed, the caseworker can scroll through these and delve further into any they think may contain more insightful information	• Comprehensive Activity Log via Notes Consolidation ○ Since caseworkers document all actions in notes, consolidation of notes provides a complete person – level audit trail ○ Consolidation of Notes for a Person from anywhere stored: ▪ Person level ▪ Integrated Case

	there are any interactions of importance		▪ Product Delivery case ○ Caseworkers no longer need to navigate around the system and into tabs on Integrated Cases to get to notes ○ Case reference retains context on case the note is in relation to ○ Removes the onus on caseworkers to know where to check and to remember to check each place ○ Caseworkers can action Notes centrally ▪ View all Note details ▪ Edit a note they're working on ▪ Delete a note
• The caseworker may need to schedule a call with the client to gather further information or validate existing information • E.g. If discrepancies in what was submitted online. Or if the existing information on the system does not tally with what was submitted or existing benefits etc	• Preparing to meet with the client, the caseworker will have had to make notes as they are navigating through the system • Manual note taking is prone to error – the caseworker may need to go back into these as they are speaking with the client, to double-check information is accurate esp. if the client contests any of the information	Using Curam Action View all information is in one place (one page) in front of the caseworker, so they don't need to write any manual notes down while they were doing research.	• Reduce the need for manual note taking ○ Curam Action View has it available centrally for reference ○ Also reduces the possibility of manual error in written notes ○ May still want to jot down notes on what specifically to ask/question

Gather data from client that needs to be updated/reflected on the system NB If no interview required, this step is missed	• Either write notes down or type into a note while talking to the client.	• “Add Note” quick action will be front and centre on Curam Action View to facilitate capturing the note during the interview • This also integrated with editable notes – so the caseworker can come back again later and add to it/tweak it etc – to reflect the full extent of what they did • Remove the overhead of writing up the notes after the fact	“Add Note” is a common action, centrally available on Curam Action View in the Quick Actions section. Caseworkers do not need to leave Curam Action View to complete this action.
Update evidence on the system. • This step may either be reflecting what was gathered during an interview (previous step) • Or, if no interview but there are evidence issues to resolve	• Navigate to the relevant Person home page and select ‘Care and Protection’ – ‘Applications’ and the relevant Application Reference • View the relevant evidence and any associated Evidence Issues ○ For edits, select the evidence type and from the list, select ‘Edit’ for any evidence that needs to be updated ○ For Issues, resolve each issue using the relevant links ○ Make the relevant updates and save ○ When evidence updates finished, go to the Verifications tab from the evidence dashboard and complete verifications one by one NB different caseworkers will have different ways to navigate to the relevant Application case.	• Go to the Application card on Curam Action View • Expand the relevant application and select one of the following: • ‘Items to verify’ • ‘In edit evidence’ • ‘Issues’ • Select the relevant evidence, verification and issue to view • Complete the relevant action for these (same as current actions) Things to Consider • These links transfer the caseworker to the list pages for each area under the Evidence Nav Bar Tab on the relevant Application Case • A quick and standardised navigation is provided to quickly transfer the caseworker to the relevant place within the application to complete their actions	Common actions centrally available, caseworkers are navigated directly to these

Progress the application so it is authorised	- Click on the Case Ref on the IC to navigate to the application home page - Select “Check Eligibility” from page menu - Select “Ready for Determination” action from Application home page menu - Select Authorise and on the modal, select the “Authorise” action against the program	From the Application card, - Select “Check Eligibility” action - The Next Steps and actions will get updated guiding the caseworker to the next “Ready for Determination” action and then to “Authorise” action - Select “Authorise” as a next steps action or from within the Application card	Common actions centrally available, caseworkers do not need to leave Curam Action View for these - These Application actions will be immediately available within the card - Caseworkers will not need to leave Curam Action View to progress these actions
Progress the benefit into delivery stage NB Most Customers will have automated workflows for these actions and activate PDCs in overnight batches	- Navigate to the Integrated Case and into the product delivery for the Benefit - Navigate into the Determinations tab, review the decision for the benefit to confirm it is as expected - Select the tab menu action to “activate case”	Go to the Cases and Entitlement card, expand the benefit in question and review the information displayed for component, entitlement amount and cover period Using the case link, caseworkers can navigate directly into the case to select the “activate case” action.	Quick access to product delivery cases reduces the navigation and clicking to access the next required action in the workflow
Caseworker captures a Note to document what they have done including notes from the call, which they therefore captured on the system.	- Navigate into the relevant notes section (PDC/IC/Person) - Create a Note capturing what occurred	Still on the Curam Action View – select the “Add Note” quick action (select the Case or Person as desired)	“Add Note” is a common action, centrally available on Curam Action View in the Quick Actions section. Caseworkers do not need to leave Curam Action View to complete this action.
